

Fast, Secure Website Hosting

GAVIN™ PREMIUM HOSTING PACKAGE

Designed for brands that demand performance and monitoring without worry.

GAVIN™
evolving influence

GAVIN™

Fast, Secure Hosting

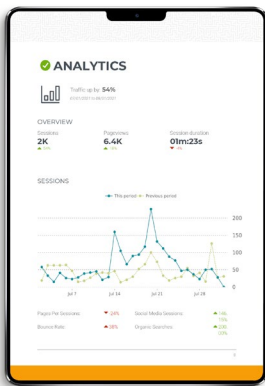

Worry-Free Hosting Package

\$1,300 per year
(12 months)

Keep up with constant change and security threats with Gavin's premium hosting package.

Gavin offers industry-leading premium hosting to support clients who value security, speed and improved user experiences. Supplement our hosting package with add-ons to support your custom changing website needs.

WHAT'S INCLUDED

Automated Reporting

Get monthly site health and performance reports delivered to your inbox every month, automatically. Our monthly standard reporting provides you a snapshot on your site's overall status and any emerging issues that may need attention.

Monthly Plug-in Updates

Consistent and timely website plug-in updates protect your site from backdoor security threats. Our hosting package includes monthly updates to standard plugins. Excludes updates to custom plugins that may require custom coding support. Custom coding updates are billed as on-demand.

Quick Fixes to Plugins

Annual hosting includes up to two (2) hours of maintenance support (per year) to fix issues that may arise when plug-ins are updated, as updates can often break code on the site. Our team fixes them without prompting. Any additional fixes needed are performed under our on-demand services, which require your approval for work to be completed. You will be notified of any additional support beyond the two hours included prior to work being completed.

cPanel Web Hosting Control Panel

- cPanel is an incredibly easy, intuitive, and advanced web hosting control panel to ensure your site is managed efficiently.
- A substantial advantage of cPanel is that it is compatible with all web browsers. cPanel works well with a wide range of browsing platforms including all the leading ones, Google Chrome, Safari, Firefox, Internet Explorer, Microsoft Edge and Opera.

Server Security

- Various security tools are available and enabled to protect your site including IP Blocker, Directory Privacy, Leech Protection, Hotlink Protection, cPHulk and ModSecurity. cPHulk provides protection from brute force attacks on web services. ModSecurity is an Apache module that provides an extra layer of protection for your account. It provides HTTP request filtering and other capabilities to help detect and block attacks before they can reach an application.
- ConfigServer Security & Firewall has been integrated for added protection. ConfigServer Security is a Stateful Packet Inspection (SPI) firewall, Login/Intrusion Detection and Security application for Linux servers.

SSL Certificates with cPanel (powered by Sectigo)

SSL certificate is included to secure your website and emails flowing through the site.

Multiple Anti-Virus & Malware Scanner

- Multiple anti-virus and malware scanners to check real-time for malware, worm, virus, XSS hacks, suspicious or compromised files, and exploits. The scan logs are manually examined to enforce preventive security measures where necessary.
- ImunifyAV+, a powerful malware scanner that provides one-click removal of malicious software and computer virus strains, ensuring protection at file-system level making sure malware has no consequences on the server.
- AV+ including a background (regular) Antivirus program that performs regular file checks in the background to keep the site and server clean.
- On-Demand Antivirus that can be run at any time by administrators or end-users to check any arbitrary folder against malware if a concern should arise.

ManageWP Backups

- Daily off-site backups.
- 90 days of available recovery points with the ability to clone the site as needed or download of a working copy of the site for development purposes if required.

Accelerate cPanel® Web Hosting with NGINX® Caching

- Faster is better. Users want fast-loading pages and so do search engines. NGINX is a web server, reverse proxy, and HTTP cache. NGINX is called a reverse proxy because it mediates access to web servers. Ensuring connections go directly to the NGINX providing added benefits including:
 - + NGINX sees everything the web server sends out onto the internet, allowing it to cache web pages.
 - + It can intercept connections to the web server and send cached responses, bypassing the web server entirely.

Additional Site Speed Performance Measures

- PHP configuration: We configure PHP with FCGI. The ultra-fast PHP-FPM accelerates PHP execution on busy web servers, making it a valuable tool in the fight against slow sites and resource-constrained servers. PHP directives are optimized for your site. Standard site compression is enabled for each site to aid in performance, based on average site size.
- Optimized apache configuration.
- Standard (free version) of Cloudflare and WPRocket are included with hosting to support speedy site performance.

ADDITIONAL SERVER INFORMATION

- Centos 7.9 Operating System
- 4 Core Intel Xeon Processor 2.2 GHz
- Standard 5 GB RAM/CPU
- Ultra-Fast SSD Hosting with RAID 1
- PHP Versions 7.4.x to 8
- MySQL with many InnoDB improvements, improvements to performance_schema, several replication improvements and improvements to the query optimizer.

UPGRADE ADD-ONS

- Increased CPU/RAM **\$500** per 10 GB of RAM/CPU
- CloudFlare Enhancement **\$25** per month
